TASK 4 REPORT

Internship Program — Batch 2026

Submitted By:	Ahmar Hayat
Department:	Web Dev
Submitted To:	Team lead
Date:	June 2026

Introduction

This report presents the work completed for Task 4 of the M-Tech Production & Marketing Web Development Internship Program, Batch 2026.

M-Tech Production & Marketing, based in Haripur, KPK, emphasizes having the right tools before coding. This task is part of Phase 1: Web Fundamentals and covers setting up the Development Environment including VS Code, VS Code Extensions, Chrome DevTools, Postman, and Node.js.

Objectives

The main objectives of this task were:

- To install VS Code as the primary code editor for web development.
- To install essential VS Code extensions for web developers.
- To learn how to use Google Chrome DevTools for debugging and inspection.
- To install Postman for future API testing.
- To install Node.js as the JavaScript runtime environment.

Work Done

1. Watched Video: "VS Code Setup for Web Dev" by Traversy Media.
2. Watched Video: "VS Code Extensions for Web Developers" by Fireship.
3. Watched Video: "Chrome DevTools Full Course" by freeCodeCamp.
4. Installed VS Code from <https://code.visualstudio.com/>

```
C:\Users\Computer Arena>code --version
1.129.1
8a7abeba6e03eaf87bfbce9a1b7e48fed567b8
x64
```

5. Installed Extensions: Prettier, Live Server, ESLint, Auto Rename Tag as suggested by Fireship video.

6. Opened Chrome DevTools using F12 and explored Console, Elements, and Network tabs.

7. Installed Postman from <https://www.postman.com/> for API testing.
8. Installed Node.js from <https://nodejs.org/> and verified with node -v.

```
C:\Users\Computer Arena>node -v
v24.14.1

C:\Users\Computer Arena>
```

Challenges Faced

Too many Extensions: The Fireship video listed 10+ extensions. I got confused so I installed only the 4 most important ones: Prettier, Live Server, ESLint, Auto Rename Tag.

Key Learnings

VS Code: It is the industry standard free code editor. The Traversy video showed how to set up themes, font size, and terminal. The integrated terminal means we don't need to open separate cmd.

Essential VS Code Extensions:

Prettier: Auto-formats code on saves. Keeps code clean.

Live Server: Opens HTML file in browser and auto-reloads on save.

ESLint: Finds errors in JavaScript code.

Auto Rename Tag: Renames closing HTML tag automatically.

Google Chrome DevTools: This is the #1 debugging tool for frontend.

Console: Run `console.log()` and see JavaScript errors.

Elements: Right-click > Inspect to change CSS live.

Network: See how long a website takes to load. We will use this a lot

Postman: A tool to test APIs without writing frontend code. We send GET and POST requests and see JSON response. This is required for Phase 4: Node.js Backend and Phase 5: Weather Widget API.

Node.js: JavaScript Runtime. Even though we are not coding backend yet, we need Node.js to run npm commands to install React and other packages in Phase 3.

Conclusion

This lab was all about preparation. The manual is right — you cannot build without tools. After this lab my laptop is now a complete Web Dev setup. VS Code is configured with the best extensions. Chrome DevTools is ready for debugging. Postman is ready for testing APIs. Node.js is installed for future phases.
