TASK 6 REPORT

Internship Program — Batch 2026

Submitted By:	Ahmar Hayat
Department:	Web Dev
Submitted To:	Team lead
Date:	June 2026

Introduction

This report presents the work completed for Task 7 of the M-Tech Production & Marketing Web Development Internship Program, Batch 2026.

M-Tech Production & Marketing, based in Haripur, KPK, focuses on building websites faster with industry tools. After learning raw CSS in Lab 2.2, this task covers CSS Frameworks. Frameworks help us build responsive, modern UIs without writing CSS from scratch. This is part of Phase 2: Frontend Development (Core).

Objectives

The main objectives of this task were:

1. To understand what CSS Frameworks are and why developers use them.
2. To learn Tailwind CSS - a utility-first framework.
3. To learn Bootstrap 5 - a component-based framework.
4. To compare Tailwind vs Bootstrap and know when to use each.
5. To use DaisyUI components with Tailwind for faster development.

Work Done

- Watched Video: "Tailwind CSS Full Course" by The Net Ninja.
- Watched Video: "Tailwind CSS Crash Course" by Traversy Media.
- Watched Video: "Bootstrap 5 Crash Course" by Traversy Media.
- Read Tailwind Docs and Bootstrap Docs to understand classes.
- Created 2 test projects in VS Code:
 - Project 1: Landing page using Tailwind CSS CDN + DaisyUI components
 - Project 2: Navbar + Cards + Grid using Bootstrap 5 CDN.\

Challenges Faced

- Too many classes in Tailwind: At first Tailwind looked messy class="flex justify-center items-center bg-blue-500". But after practice it became faster than writing custom CSS.
- Bootstrap overriding: Bootstrap has default styles. I had to learn how to override them with custom CSS.
- CDN vs Install: I used CDN to keep it simple for now. Learned that for production we use npm install.

Key Learnings

- **What are CSS Frameworks:** Pre-written CSS code that gives us ready-made classes and components. Saves time. No need to write display: flex 100 times.
- Tailwind CSS - Utility First:

You style directly in HTML using utility classes. Example: `<button class="bg-blue-500 text-white px-4 py-2 rounded">Click</button>`

Pros: Super-fast, fully customizable, small final CSS size

Cons: HTML looks cluttered at first
Extra: DaisyUI gives us ready components like buttons, cards, navbar for Tailwind

- Bootstrap 5 - Component First: You use pre-built components and grid system. Example: `<button class="btn btn-primary">Click</button>`
Pros: Fast to prototype, consistent design, great docs
Cons: All Bootstrap sites look similar unless customized

- Tailwind vs Bootstrap:

	Tailwind CSS	Bootstrap 5
Style	Utility Classes	Components
Customization	100% Custom	Needs overriding
File Size	Smaller with purge	Larger
Best For	Custom Designs	Admin panels, quick sites

When to use what:

- Use Bootstrap when you need to build fast and don't care about unique design. Good for dashboards.
- Use Tailwind when you want a custom brand look. This is what most companies use in 2026.

Conclusion

This lab taught me how professional developers build websites 10x faster. Writing raw CSS for everything is slow. I personally liked Tailwind CSS more. At first, it looked weird, but after 1 hour it clicked.

The control it gives is insane. DaisyUI made it even better because I got beautiful components without writing CSS. Bootstrap is still great for quick projects and for people who are new. The grid system and components are plug-and-play.
