TASK 1 REPORT

Internship Program — Batch 2026

Submitted By:	Ahmar Hayat
Department:	Web Dev
Submitted To:	Team Lead
Date:	June 2026

Introduction

This report presents the work completed for Task 3 of the M-Tech Production & Marketing Web Development Internship Program, Batch 2026.

M-Tech Production & Marketing, based in Haripur, KPK, emphasizes practical skills. Version control is a critical skill for every developer. This task is part of Phase 1: Web Fundamentals and covers Git & GitHub, which we will use to submit all future labs and projects.

Objectives

The main objectives of this task were:

- To understand what Version Control is and why it is important.
- To learn the difference between Git and GitHub.
- To set up a GitHub account and create our first repository.
- To learn basic Git commands: git init, git add, git commit, git push.
- To understand how GitHub will be used for submitting all lab work.

Work Done

Watched video: "Git and GitHub for Beginners" by Traversy Media.

Read MDN docs: "Version Control" and GitHub Docs.

Created a GitHub account: <https://github.com/ahmarhayat>

Installed Git on my PC and configured username and email using git config.

Initialized git locally, added Lab 1 and Lab 2 reports, and pushed them using:

```
bash git add .
```

```
git commit -m "Added Lab 1 and Lab 2 reports"
```

```
git push origin main
```

Challenges Faced

Push Error: I got an error "failed to push" because I didn't set the upstream branch.

Key Learnings

What is Version Control: It is a system that records changes to files over time. Like "Save As v1, v2" but professional. If we break code, we can go back to previous version. Git vs GitHub: Git: Software installed locally. Tracks changes.

Commands: add, commit, branch. GitHub: Cloud platform to host Git repositories. Used for collaboration, portfolio, and submitting work. Basic Git Workflow:

```
bash git init    # Start tracking a folder  
git add .        # Stage all files  
git commit -m "message" # Save a version  
git push         # Upload to GitHub
```

Importance of Commits: Each commit should have a clear message. This helps team leads check our progress. The rubric says "Code Quality & Documentation" depends on this.

GitHub for Portfolio: Companies check GitHub before hiring. By the end of this internship we will have 10+ projects on our profile. This matches Phase 10: "✓ GitHub Portfolio" in the PPT.

Collaboration: In real jobs, multiple developers work on same code using branches and pull requests.

Conclusion

This lab taught me one of the most important skills for a developer: Version Control. Before this I used to save files as final-v2-final.docx. Now I know how to properly track changes using Git. Setting up GitHub was also very useful because it will be the main way we submit our work for the next 9 phases. Every lab, mini-project, and final project will be pushed to this repository. This means my GitHub will become my professional portfolio by the end of the internship.

I also learned that making small commits with good messages is better than 1 big commit. This will help me in team projects later. Now I am comfortable with git add, commit, and push and ready to use GitHub for all future labs like React To-Do and Node.js E-commerce.
